1992:174893 Document No. 116:174893 Synthesis of multifunctional
copolyamides with both cyclobutane ring and conjugated double bond
in the main chain. Nishikubo, Tadatomi; Iizawa, Takashi; Shiozaki,
Yasunori; Koito, Tsutomu (Fac. Eng., Kanagawa Univ., Yokohama, 221,
Japan). Journal of Polymer Science, Part A: Polymer Chemistry,
30(3), 449-59 (English) 1992. CODEN: JPACEC. ISSN: 0887-624X.
AB Copolyamides contg. both cyclobutane rings and conjugated double
bonds in the main chain were prepd. by polycondensation of
1,3-di(4-piperidyl)propane (I) with .beta.-truxinate (II),
di(p-nitrophenyl) p-phenylenebisacrylate (III), di(p-nitrophenyl)
p-phenylenebis(.alpha.-cyanoacrylate) (IV), and di(p-nitrophenyl)
p-phenylenebis(.alpha.-cyanobutadienecarboxylate) (V) in aprotic
polar solvents at room temp. Reduced viscosity of the copolyamide
was strongly affected by the reaction process, the molar ratio of
two ester monomers, and reaction time. The copolyamide with the
highest viscosity was prepd. by the reaction of I with 70-50 mol% II
for 24 h followed by the polycondensation of the resulting precursor
with 30-50 mol% III for 24-96 h. Although copolyamide with high
viscosity was not obtained by polycondensation with II and IV,
copolyamide with relatively high viscosity was obtained by reaction
with II and V. The soly. of copolyamides decreased gradually with
increasing III, IV, and V units in the copolymers. The copolyamides
crosslinked upon irradiation with 313 or 365 nm light and
decompd. upon irradiation with 254 nm light. The photochem. property of
these copolyamides can be controlled by the selection of wavelength
of the photoirradiation.

 silver staining. Hochstrasser, Denis F.; Patchornik, Abraham;
 Merrill, Carl R. (Biochem. Genet. Sect., Natl. Inst. Ment. Health,

 (English) 1988. CODEN: ANBCA2. ISSN: 0003-2697.
 AB Background staining that is assocd. with Ag detection of proteins
 and nucleic acids in polyacrylamide gels was due mostly to the amide
 groups in methylenebisacrylamide, a commonly used gel
crosslinker. To reduce this background staining, 8 existing
crosslinking agents were tested; all were unsuitable. Six
 new **crosslinking** agents were synthesized and tested. Of
 these, diacrylylpiperazine provided increased phys. strength,
 improved electrophoretic sepn. of proteins, and Ag staining
 detection of proteins with reduced background stain.

Because of having

an excellent IgE antibody prodn. inhibitory effect, these compds. are useful as antiallergic agents for the treatment of allergic immune diseases such as asthma, atopic dermatitis, allergic rhinitis, inflammatory colon diseases, contact skin diseases, and allergic eye diseases. Thus, (E,E)-5-(3,4,5-trimethoxyphenyl)-2,4-pentadienoic acid was treated with oxalyl chloride in DMF /CH₂Cl₂ at room temp. for 30 min and then condensed with 1,3-bis(piperazin-1-yl)propane (II; R = H) tetrahydrochloride in the presence of diisopropylethylamine in CH₂Cl₂ to give II (R = Q), which at 10⁻⁶ M inhibited by 100% the prodn. of IgE in B cell from mouse (Balb/C) spleen.

AB The title stable mixtures, which formed polyureas on exposure to moisture, were prep'd. by mixing a dienamine, e.g. comp'd. (I) [38233-98-6], or a monoamine contg. an OH, NH₂, ketimine, or aldimine group, e.g. comp'd. (II) [38233-99-7], with a polyisocyanate, e.g., isophorone diisocyanate (III) [26602-93-7]. The mixts. were useful as coating compns., sealants, etc. Thus, 4,4'-dipiperidylpropane reacted with isobutyraldehyde to form I. I (10 parts) was mixed with 6.9 parts III in ethylene glycol acetate to form a 50% soln. In the absence of moisture, the mixt. was stored 12 weeks without a viscosity change. When a soln. was poured out on a surface and exposed to air with 60% relative humidity, a clear tackfree film was formed in 90 min.

AB The title compds. (I) were prepd. from the reaction of the corresponding substituted piperidine with acrylonitrile and Et₃N. I was then reduced to the corresponding mono- and bis-piperidylpropylamines. These were then treated with 4,7-dichloroquinoline (II) to give the corresponding piperidylpropylamino-7-chloroquinolines (III). Thus, 18.82 g. 4-carbamoylpiperidine acetate and 13.11 g. Et₃N in 125 ml. H₂O was treated during 1 hr. with 5.58 g. acrylonitrile at 14-20.degree. and the mixt. stirred 1 hr. and kept overnight to give 12.4 g. I (R = 4-CONH₂), m. 151-2.6.degree.. Redn. of this compd. in EtOH, i.e. in neutral soln., over 5% Rh-Al₂O₃ at 210 psi. gave IV (R = 4-CONH₂), m. 85-8.degree.. The following I and IV were prepd. (R, m.p. or b.p. I, n25D I, m.p. or b.p. and the reaction carried out with continuous stirring at
65-75.degree. and 60 mm. pressure to give II (R = oleoyl, R1 = R2 =

R4 = R6 = H, R3 = 3-oleoyloxypropyl) which was cold saponified to II (R = oleoyl, R1 = R2 = R4 = R5 = H, R3 = CH2CH2CH2OH) (IIb). To a soln. of 26 g. IIb, 5.1 g. C5H5N, and 75 ml. C6H6, 5 g. Plasticizers for chlorine-contg. polymers. Klug, Helmut; Jochinke, Helmut; Bollinger, Richard (Farbwerke Hoechst A.-G.). DE 1202485 19651007, 2 pp. (Unavailable). APPLICATION: DE 19600209.

AB The addn. of 5-15% of chlorinated aliphatic esters to chlorinated natural paraffins substantially eliminated the tendency to exude when used to plasticize poly(vinyl chloride) or other chlorinated polymers. The C8-22 aliphatic esters contained 10-40% Cl. The paraffins, m. 30-55.degree., were chlorinated to 35-55% Cl.

AB The title compds. are plasticizers for vinyl chloride resins, and they show a wide spectrum of anti-fungal and anti-microbial activity. They are also softeners of Buna rubber. Twenty-two and four-tenths g. of piperidine were dissolved in 60 cc. of C6H6 and 39.7 g. of oleoyl chloride were added dropwise with stirring. After stirring for an addnl. hr., the mixt. was filtered, washed with dil. HCl and H2O, and dried over anhyd. Na2SO4. Free acid was removed by percolating the C6H6 soln. through a column of activated Al2O3 and eluting the amide with a 1:1 EtOH-C6H6 mixt. The solvent was removed in vacuo leaving N-oleoylpiperidine.
